Technical Appendix A: Methodology

This study focuses on all 32,261 individuals who completed eligible applications for summer 2017 Birthright Israel trips from the United States and Canada. Of this group, 23,392 applicants participated in a trip that summer, and 8,869 did not participate. The study was conducted as a “failed census,” meaning that attempts were made to contact all known members of the population, rather than just a random sample. The study was composed of a pair of online surveys, one conducted before the trip and another several months after trip participants returned from Israel.

Pre-trip Survey

The pre-trip survey was conducted shortly prior to the trips via an online questionnaire. A total of 29,935 applicants were invited to take the survey. Not sent pre-trip surveys were 2,315 eligible members of the frame whose applications were not complete before the beginning of data collection. Email invitations were sent on March 30, 2017 followed by reminder emails on April 5, April 13, April 21, and May 1. The survey closed May 9, 2017. All respondents were offered the opportunity to win one of two $100 Amazon.com gift cards. A total of 6,938 completed the survey (6,127 complete survey and 811 partial surveys) for a response rate (AAPOR RR2) of 23.2% (Table A1).

A subsample of 3,000 applicants residing in the continental United States was randomly selected to receive follow-up phone calls. The study utilized experienced callers who received special training on interacting with respondents and using the CMJS survey management system. All individuals in this subsample were called once and encouraged to complete the survey. Callers left voice messages if they could not reach individuals directly. Following the phone call, all individuals were sent an email with a link to the survey. Calling operations for the pre-trip survey took place between April 20 and April 27. The response rate for this subsample was 28.8%.

Table 1 shows final dispositions and AAPOR response rates for the entire population, as well as separately for summer 2017 participants and nonparticipants (note that at the time of the pre-trip survey no trips had actually left). The 2,315 individuals who were not surveyed are considered non-contacts in the table below.

**Post-trip Survey**

The post-trip survey was conducted three to six months after the trip via an online questionnaire. A total of 31,264 individuals were invited to take the survey. Email invitations were sent on November 13, 2017, and reminder emails were sent on November 21, November 27, December 4, and December 21. The survey closed January 16, 2018. Both participants and non-participants were invited to participate in the survey. All respondents were offered the opportunity to win one of ten $100 Amazon.com gift cards. A total of 4,668 completed the survey (4,168 complete surveys and 500 partial surveys) for a response rate (AAPOR RR2) of 14.9% (17.0% for participants, 9.6% for non-participants).

A subsample of those who completed the pre-trip survey, as well as a selected group of participants on some campus trips were selected to receive follow-up phone calls that encouraged survey completion. A total of 6,324 participants and 1,046 nonparticipants were in this group. The study utilized experienced callers who received special training on interacting with respondents and using the CMJS survey management system. All individuals in this subsample were called once and were encouraged by callers to complete the survey. Callers left voice messages if they could not reach individuals directly. All individuals were sent an email with a link to the survey following the phone call. Calling operations took place between November 29 and December 27.

**Weighting**

Because both surveys were sent to all members of the population, no design weights were needed to account for unequal probabilities of selection. However, the survey population was divided into calling and non-calling strata. Because the additional individuals who were called were a random sample of the population, no weights were needed to account for these individuals’ higher probability of selection. However, design weights were created to account for the different levels of effort involved in contacting applicants in different strata.

Furthermore, due to unit nonresponse, there were a number of significant differences between the characteristics of survey respondents and the characteristics of the full population. This could be determined empirically because a significant amount of demographic data is available in Birthright’s
registration system for the entire population, including survey nonrespondents. The non-response analysis revealed that applicants who responded to the surveys and applicants who did not were very similar on a variety of demographic and Jewish background measures. There were only three systematic differences between those who completed the pre- and post-trip surveys and those who did not: Survey respondents were more likely to be female (68% of survey respondents compared to 57% of all applicants), age 22 or older (57% of respondents vs. 51% of applicants), and have only one Jewish parent (38% of respondents vs. 32% of applicants). Weights were calculated to adjust for this response bias.

Three sets of weights were calculated: for respondents to the pre-trip survey, respondents to the post-trip survey, and those who responded to both the pre- and the post-trip survey. In each case the weights began with the design weights calculated to account for the stratification into calling and non-calling strata, and weights for respondents in question were then adjusted so that the demographic characteristics of respondents to the pre-trip survey, the post trip survey or both surveys, matched those of the full population. This weighting procedure (often known as “raking”) iteratively adjusts on each specified variable in turn, until the difference between the weighted estimate and target value for each variable is below a minimum specified level. Weights for this study were computed in Stata using the user written “survwgt” command.

Analysis

Analyses were conducted using Stata 15.1 and the “svy” suite of commands for weighted data. Data were variously drawn from the Birthright registration system, the pre-trip survey, and the post-trip survey, and appropriate weights were applied to each analysis based on the source or sources of the data. Throughout the report, only weighted proportions—usually two-way tables of frequencies—are presented. However, the substantive relationships between variables presented in this report have been confirmed by a series of statistical models.

In sections of the reports describing the applicant pool, and participant reports on the Birthright trip itself, a number of regression models were run to determine whether participants with different political views, or those who had received the social diversity module, reported different trip experiences, after controlling for their different demographic and Jewish background characteristics. The specification of these models is described in the endnotes of the main report, and full results are available upon request.

Evaluating Birthright Israel’s Impact

In evaluation research there are two major threats to validity. The first is selection bias—the possibility that those who receive the treatment were already more likely to experience the desired outcome even before receiving the treatment. The second is history bias—the possibility that external forces other than the treatment caused the entire population (including those who did not receive the treatment) to improve during the period under investigation.
CMJS research compares Birthright participants to a control group of Birthright applicants who were not selected to participate in the trip. Because assignment to trips among those who applied is more or less random, the likelihood of selection bias is reduced. However, to fully guard against this possibility, and to prevent history bias, we survey both participants and nonparticipants both before and after the trip and make use of a method of analysis known as “difference-in-differences” models, that is explicitly designed for this purpose.

These models were run on a “reshaped” version of the dataset, where pre and post observations were “nested” within individuals. In a difference-in-difference model the impact of the trip is evaluated as the difference between the pre to post change experienced by the participants and the pre to post change experienced by the control group. If the treatment group improves, but the control group improves by the same amount, then there has been no treatment effect. Conversely, if the control group increases, but the treatment improves more, then the effect of the trip is the difference between the two improvements.

Difference-in-difference models are evaluated using regression models that include three key variables: an indicator for whether an observation was part of the treatment or control group, an indicator for whether the observation is from before or after the intervention, and an interaction term between these two indicators. The interaction term shows the impact of the intervention. In this case, these analyses were run as random-effects models to account for the clustering of observations within individuals.

To illustrate this procedure Table A3 presents the full results for the difference-in-differences model confirming Birthright’s impact on connection to Israel (illustrated in Figure 9). Because the dependent variable is ordinal, the model is run using random effects ordered logistic regression.

The binary variable “participant” equals 1 for individuals who participated in a Birthright trip and zero otherwise. Note that this variable is also 1 for pre-trip observations of participants. The binary variable “time” is 1 for post-trip observations, and 0 for pre-trip observations. The interaction term “participant#time” is the product of these two variables.

The coefficient for the participant variable is negative and marginally significant at p<.1. Because of the presence of an interaction term in the model, this coefficient tells us that that, before the trip, applicants who would eventually participate on a trip were slightly less connected than applicants who would not be offered trips. The coefficient for the time variable is nonsignificant, indicating that nonparticipants did not become more connected to Israel between the pre and post surveys. The interaction term is positive and highly significant, indicating an increase in connection to Israel for participants between the pre and post surveys, above and beyond any increase experienced by nonparticipants (which in this case was nonexistent). This model therefore tells us that Birthright had a positive, significant impact on connection to Israel, and that nonparticipants did not become more or less connected to Israel in this period.

Similar models are used to evaluate Birthright’s impact on all outcomes discussed in the report. Weighted tables of frequencies were only presented when such models could confirm Birthright’s impact. To evaluate whether Birthright had a differential impact on liberal, moderate, or conservative participants, additional models were run for participants only, with dummy variables for political ideology interacted with time. In the small number of situations where nonparticipants also significantly changed, comparable models were also run for nonparticipants.

Complete results for all models discussed in this report are available upon request.

Technical Appendix C: Survey Instruments
Thank you for participating in Brandeis University's study of young adults who applied to go on Birthright Israel this coming summer. In the survey we will ask you about your views, your interest in the program, and about your upbringing and current activities. You were specifically selected to participate in this study and your responses are very valuable.

The survey will take about **15 minutes** to complete and when you are done you will be entered into a lottery and have a **chance to win one of two $100 Amazon.com gift cards**.

This survey is **NOT optimized for mobile devices**.

This survey is conducted by the Cohen Center for Modern Jewish Studies at Brandeis University. Your individual responses will be kept strictly confidential and only aggregate data will be reported. No one outside the research team will have access to the data. Your participation in the survey is entirely voluntary. If you wish, you may decline to answer specific questions, and you may conclude the survey at any point.

If you have any questions or concerns regarding the survey, please contact us at isrlstudy@brandeis.edu or call Naomi Weinblatt at 781-736-3821. You may also contact the Brandeis Committee for the Protection of Human Subjects (781-736-8133, irb@brandeis.edu). This committee works to safeguard the interests of individuals who participate in Brandeis-sponsored research.

BRI 36 Summer 2017 Post-Trip

Thank you for participating in Brandeis University’s study of young adults who applied to go on Birthright Israel this past summer. This survey follows up on the survey you completed in the Spring. In this survey we will ask about your views, your experience on the trip, and about your current activities.

The survey will take about 15 minutes to complete and when you are done you will be entered into a lottery and have a chance to win one of ten $100 Amazon.com gift cards.

This survey may be completed on a mobile device.

This survey is conducted by the Cohen Center for Modern Jewish Studies at Brandeis University. Your individual responses will be kept strictly confidential and only aggregate data will be reported. No one outside the research team will have access to the data. Your participation in the survey is entirely voluntary. If you wish, you may decline to answer specific questions, and you may conclude the survey at any point.

If you have any questions or concerns regarding the survey, please contact us at isrlstudy@brandeis.edu or call Naomi Weinblatt at 781-736-3821. You may also contact the Brandeis Committee for the Protection of Human Subjects (781-736-8133, irb@brandeis.edu). This committee works to safeguard the interests of individuals who participate in Brandeis-sponsored research.
